## Get your whitest smile with your dental treatment.

The tooth whitening with WHITEsmile gels is a process that dissolves the discoloration in the enamel by an oxygen reaction. Most common reasons for darker teeth are coloring food and beverages. The procedure is non-invasive for your teeth and gives you a perfect smile. A professional tooth cleaning is recommended before each tooth whitening treatment.

**Ask your practice team about the possibility of tooth whitening.**

### FAQ

#### **Tip: Tooth Whitening before restorative treatments!**

Prosthetic treatments, such as inlays, crowns or implants cannot be altered in color when placed. Benefit now from professional tooth whitening and get your brightest smile now.

#### **Is the system safe?**

A variety of studies have shown that this type of tooth whitening is safe for teeth and gums. The active ingredient hydrogen peroxide has been successfully used in dentistry for decades.

#### **How long do the results last?**

With normal care of your teeth by brushing, flossing and regular professional dental cleaning your teeth will always be lighter than before treatment. A post treatment can be offered as part of a regular preventive maintenance treatment. A post-treatment with home whitening is also possible.

#### **Are there any side effects?**

Usually the treatment is painless. Some patients might get an increased sensitivity during or after treatment. All side effects are usually over after 1-2 days. If required, your dentist can recommend products against tooth sensitivity, which can be used after the treatment. What do I need to think about after the treatment? For at least 4 hours (minimum) after whitening, please refrain from consuming tea, coffee, red wine, cigarettes etc., as this will reduce the effectiveness of the treatment.

#### **How does it work?**

Stains and discolorations are gently dissolved with all methods. Your practice team will recommend the best choice to you.
